Coating powder IGP-DURA®sky 9503

Owner of the declaration

IGP Pulvertechnik AG
Ringstrasse 30
9500 Wil
Switzerland

Declared product / declared unit

Coating powder IGP-DURA®sky 9503 for the manufacturing of ultra-high weather-resistant powdercoating finishes, declared unit 1 kg

Scope:

This Environmental Product Declaration declares a representative formulation of an organic, thermosetting coating powder of the 95 series from the manufacturer IGP Pulvertechnik AG.
The declaration covers the reproducible colour range of the solid and pearl mica effect shades of the ultra-high weather-resistant product group: IGP-DURA®sky 9503.
The declared products refer to the development and production site in Wil, Switzerland.
The owner of the declaration shall be liable for the underlying information and evidence; the IBU shall not be liable with respect to manufacturer information, life cycle assessment data and evidences.

The EPD was created according to the specifications of EN 15804+A2. In the following, the standard will be simplified as *EN 15804 bezeichnet*.

Verification

The standard EN 15804 serves as the core PCR

Product

Product description/Product definition

The product groups of the 95 series belong to the ultra-high weather resistant quality level and are based on fluoropolymers of the FEVE (Fluoroethylene

Vinyl Ether) group, as well as saturated copolymer resins, corresponding Triglycidyl Isocyanurate (TGIC)-free hardeners and UV- light resistant pigments.

The series includes the following surface finishes:

IGP-DURA@sky 9503A smooth, matt, uni;

IGP-DURA@sky 9503E smooth finish, matt with pearl effect.

The product groups are characterised by the highest chalking and colour stability. Coating Powder is a product for which no legal provisions for harmonisation of the EU exist.

For the use and application of the product, the respective national provisions at the place of use apply.

Application

IGP-DURA@sky 9503 is a matt ultra-high weather resistant coating for high gloss and colour stable, chalking-resistant surfaces for high-value object facades made of metal substrates, as well as for surfaces with good sliding properties and for high chemical stresses.

Good adhesion to the substrate requires the formation of a conversion layer, which also works well with approved chrome-free pretreatment chemicals.

Technical Data

The powder coating films of IGP-DURA@sky 9503 which were applied according to the technical data sheet at a recommended film thickness of approx. 60 µm have the following technical properties:

Powder and film properties

Name	Value	Unit

Product definition:

The coating powder is not subject to EU harmonisation legislation: the use of the product is subject to the respective national regulations at the place of use.

Base materials/Ancillary materials

The

declaration refers to the following composition of the coating powder

IGP-DURA@sky 9503:

Name	Value	Unit
Binder (resin and hardener)	67- 80	%
Pigments (coloured/ effect pigments)	0- 5,3	%
Titanium dioxide	0- 24,5	%
Extender	2,7- 18,2	%
Additives	3,3- 7,2	%

All

articles of series 95 comply with the REACH Regulation (EC) No 1907/2006.

Substances of very high concern (SVHC) according to the Candidate List,

17.01.2022, as well as substances of Annex XIV of REACH Regulation (EC) No.

1907/2006 are not included above the legal threshold of 0.1%.

Articles of series 95 further comply with Directive (EU) 2015/863 (RoHS 3).

The product/article/at least one sub-article contains other carcinogenic, mutagenic, reprotoxic (CMR) substances of category 1A or 1B, which are not on the candidate list, above 0.1 % by mass in at least one sub-article: no

Biocidal products have been added to this construction product or it has been treated with biocidal products (it is thus a treated product in the sense of the Biocidal Products Regulation (EU) No. 528/2012): no

Environment and health during use

LCA: Calculation rules

Declared Unit

The declared unit and the mass reference must be indicated in the appropriate table as declared. If there are several units to choose from, a suitable one must be selected. If averages are declared across various products, the average breakdown must be explained.

The declared unit is 1 kg. Other declared units are permissible if conversion to 1 kg is depicted in a transparent manner. The mean values for the gross density of the products depicted must also be indicated.

A declared unit of 1 m² is to be assumed for products in panel form, whereby the proportion of joins per m² ready-coated area must be taken into consideration.

Practical reference values concerning the use status of the various end products can be indicated, e.g. yield, density, consumption per m², component density etc.

The declared unit refers to 1 kg of 95er Fluoropolymer coating powder product.

Name	Value	Unit
Gross density (mean value)	1450	kg/m ³
Declared unit	1	kg

This EPD declares a representative composition for all products under study. This composition is representative because it considers a powder coating formulation with the highest environmental impacts (within a 10% range).

For IBU core EPDs (where clause 3.6 is part of the EPD): for average EPDs, an estimate of the robustness of the LCA values must be made, e.g. concerning variability of the production process, geographical representativeness and the

Reference service life

When surfaces coated with IGP-DURA@sky 95 are properly maintained, the service life of the surfaces corresponds to the service life of the building. Changes in colour and gloss due to weathering do not impair the protective effect.

The ageing of the material is mainly caused by the effects of UV radiation and moisture. Both influences can lead to changes in gloss and colour within the permissible tolerance range of the GSB (Quality association for ensuring the coating quality of workpieces and the pre-treatment and coating materials used in the process by drawing up and monitoring quality guidelines)

and Qualicoat quality associations. Delamination of the coating must not occur in this case. High concentrations of atmospheric agents such as industrial waste gases or chlorides - e.g. from de-icing salts - can lead to an irreversible impairment of the protective effect of the coating. The protective effect of the coating film can be irreversibly impaired in high concentrations, even to the point of infiltration and detachment.

influence of background data and preliminary products compared to the environmental impacts caused by actual production.

System boundary

The type of EPD is cradle to gate with modules C1–C4, and module D (A1–A3, C, D).

The life cycle assessment includes the provision of raw materials (module A1), transport to the production site (module A2) and the manufacturing processes of the powder coating and packaging material (module A3). The coating process is outside the scope of the study.

The CO₂ emissions from biogenic carbon in the packaging material are released within A1-A3.

At the end of its life, the product is transported to the disposal company (module C2) and then disposed of (module C4).

Geographic Representativeness

Land or region, in which the declared product system is manufactured, used or handled at the end of the product's lifespan: Europe

Comparability

Basically, a comparison or an evaluation of EPD data is only possible if all the data sets to be compared were created according to *EN 15804* and the building context, respectively the product-specific characteristics of performance, are taken into account.

LCA: Scenarios and additional technical information

Characteristic product properties

Information on biogenic carbon

The biogenic carbon content quantifies the amount of biogenic carbon in a construction product leaving the factory gate, and it shall be separately declared for the product and for any accompanying packaging.

If the total mass of biogenic carbon containing materials is less than 5 % of the total mass of the product and accompanying packaging, the declaration of biogenic carbon content may be omitted. The mass of packaging containing biogenic carbon shall always be declared.

Note: 1 kg of biogenic carbon is equivalent to 44/12 kg of CO₂.

The calculation of the biogenic carbon content is based on the assumption, that the (absolutely) dry wood and cardboard mass consists of 50 % biogenic carbon. No biogenic carbon content exists in any of the products under study, only packaging materials.

The CO₂ emissions from biogenic carbon in the packaging material are released within A1-A3.

Name	Value	Unit
Biogenic carbon content in accompanying packaging	0.0363	kg C

The following information was used to calculate the declared modules:

In case a **reference service life** according to applicable ISO standards is declared then the assumptions and in-use conditions underlying the determined RSL shall be declared. In addition, it shall be stated that the RSL applies for the reference conditions only.

The same holds for a service life declared by the manufacturer. Corresponding information related to in-use conditions needs not be provided if a service life taken from the list on service life by BNB is declared.

End of life (C1-C4)

- Module C1: Manual dismantling (no environmental loads).

- Module C2: An average transport distance of 200 km is assumed by truck.

- Module C4: As a disposal scenario, it is assumed that the coating powder, which is located on an aluminium surface during disposal, is thermally disposed of during the recycling of the aluminium (melting/burning). No credits were awarded for combustion on the basis of energy substitution, but only the resulting emissions were taken into account.

Name	Value	Unit
For thermal utilisation without energy recovery	1	kg

LCA: Results

In Table 1 "Description of the system boundary", all declared modules shall be indicated with an "X"; all modules that are not declared shall be indicated with "MND" (As default the modules B3, B4, B5 are marked as MNR – module not relevant). In the following tables, columns can be deleted for modules that are not declared. Indicator values should be declared with three valid digits (eventually using exponential form (e.g. 1,23E-5 = 0,0000123). A uniform format should be used for all values of one indicator.

If several modules are not declared and therefore have been deleted from the table, the abbreviations for the indicators can be replaced by the complete names, while the readability and clear arrangement should be maintained; the legends can then be deleted. If due to relevant data gaps, an indicator cannot be declared in a robust way, then the abbreviation "IND" (indicator not declared) should be used for this indicator.

- 0 - calculated value is 0
- 0 - value falls under the cut-off
- 0 - assumption which exclude any flows (e.g. exported electricity A1-A3)
- IND – in cases where the inventory does not support the methodological approach or the calculation of the specific indicator IND shall be used.

If no reference service life is declared (see chapter 2.13 "Reference Service Life"), the LCA results of the modules B1-B2 and B6-B7 shall refer to a period of one year. This shall then be indicated as an explanatory text below the tables. In addition, the formula for the quantification of such B-modules over the total life cycle shall be provided.

DESCRIPTION OF THE SYSTEM BOUNDARY (X = INCLUDED IN LCA; ND = MODULE OR INDICATOR NOT DECLARED; MNR = MODULE NOT RELEVANT)

Disclaimer

1 – for the indicator “Potential Human exposure efficiency relative to U235”.

This impact

category deals mainly with the eventual impact of low-dose ionizing

radiation

on human health of the nuclear fuel cycle. It does not consider effects due to possible

nuclear

accidents, occupational exposure or radioactive waste disposal in underground

facilities.

Potential ionizing radiation from the soil, radon and from some construction materials is also not measured by this indicator.

Disclaimer

2 – for the indicators “abiotic depletion potential for non-fossil resources”, “abiotic depletion potential for fossil resources”, “water (user) deprivation potential, deprivation-weighted water consumption”, “potential comparative toxic unit for ecosystems”, “potential comparative toxic unit for humans – cancerogenic”, “Potential comparative toxic unit for humans - not cancerogenic”, “potential soil quality index”.

The results

of this environmental impact indicator shall be used with care as the

uncertainties

on these results are high as there is limited experience with the indicator.
