Bamboo for deforestation-free products

This project at Rio Kama in Eastern Nicaragua has planted over 1 million plants of a native species of giant clumping bamboo, covering 2'361 hectares which protecting an additional 1'000 hectares of old forest as a conservation zone. It has transformed a degraded landscape into a flourishing and biodiverse ecosystem. Bamboo is one of the most efficient biological tools for fighting climate change. This project contributes to the mitigation of climate change by preventing deforestation and capturing CO₂e.

Project standard: Verified Carbon Standard (VCS)

17.05.2023 / Managing Partner CarbonCare, Dr. Peter Wild

* Calculation of CO₂e according to the regulations of the norm EN 16258.
